

Student ID:	20230204030
Student Name:	Ahona Zabin
Section:	A2
Project Name:	Smart Greenhouse Monitoring System
Day	Your Contribution to the project
1	Identified the automatic irrigation section and selected the 12V DC water pump, relay module, and required wiring connections.
	Planned the pump-control logic based on the soil-moisture sensor reading.
	Prepared the initial wiring layout for the water-pump section.
2	Connected the 12V DC water pump with the relay module and power supply.
	Connected the relay control input with the ESP32.
	Checked the pump wiring and verified proper ON/OFF operation.
3	Implemented the automatic pump-control logic using the soil-moisture sensor.
	Programmed the pump to turn ON when the soil becomes dry and turn OFF when sufficient moisture is detected.
	Tested the irrigation response under different soil-moisture conditions.
4	Adjusted the soil-moisture threshold for stable and accurate pump operation.
	Checked the pump, relay, and power connections and corrected loose or incorrect connections.
	Supported integration of the irrigation section with the other greenhouse modules.
5	Participated in the final full-system integration and testing.
	Verified that the automatic irrigation system operated correctly with the ESP32 and soil-moisture sensor.
	Contributed to troubleshooting and final demonstration preparation.

Student ID:	20230204047
Student Name:	Fahmida Afrin Nadia
Section:	A2
Project Name:	Smart Greenhouse Monitoring System
Day	Your Contribution to the project
1	Identified the rain-detection and automatic roof-control section and selected the rain sensor, SG90 servo motor, and required wiring connections.
	Planned the control logic for opening and closing the greenhouse roof based on rain detection.
	Identified the LM2596 buck converter for providing suitable regulated voltage to the low-voltage components.
2	Connected the rain sensor with the ESP32 and checked the sensor readings.
	Connected the SG90 servo motor with the ESP32 and tested its basic movement at different angles.
	Connected and adjusted the LM2596 buck converter to obtain the required regulated output voltage.
3	Implemented the automatic roof-control logic using the rain sensor and servo motor.
	Programmed the servo to close the roof when rain is detected and return to its normal position when rain stops.
	Tested the rain sensor, servo motor, and buck-converter output during circuit operation.
4	Adjusted the rain-sensor threshold and servo angles for stable roof operation.
	Checked the buck-converter voltage and wiring connections during full-system integration.
	Prepared presentation slides describing the project system, working procedure, and automatic roof-control section.
5	Participated in the final full-system integration and testing.
	Verified that the rain sensor, servo-controlled roof, and regulated power supply worked correctly with the complete greenhouse system.
	Finalized the presentation slides and contributed to troubleshooting and final demonstration preparation.

Student ID:	20230204114
Student Name:	Afifa Faija
Section:	A2
Project Name:	Smart Greenhouse Monitoring System
Day	Your Contribution to the project
1	Identified the automatic lighting section and selected the LDR module, 12V LED light, relay module, and required wiring connections.
	Planned the lighting-control logic based on the detected light intensity.
	Prepared the initial wiring layout for the LDR and LED-light section.
2	Connected the LDR module with the ESP32 and checked the sensor readings.
	Connected the 12V LED light through the relay module and power supply.
	Tested the basic ON/OFF operation of the LED light.
3	Implemented the automatic lighting-control logic using the LDR module.
	Programmed the LED light to turn ON when the surrounding light is insufficient and turn OFF when enough light is available.
	Tested the lighting system under bright and low-light conditions.
4	Adjusted the light-sensor threshold for stable and accurate LED operation.
	Checked the LDR, relay, LED light, and wiring connections during system integration.
	Prepared and organized the project report sections, including system description, working procedure, and related project information.
5	Participated in the final full-system integration and testing.
	Verified that the automatic lighting section worked correctly with the complete greenhouse system.
	Finalized the report formatting, tables, figures, and written content for final submission.

Student ID:	20230204117
Student Name:	Afra Anan
Section:	A2
Project Name:	Smart Greenhouse Monitoring System
Day	Your Contribution to the project
1	Identified the temperature-monitoring and ventilation-control section and selected the DHT22 sensor, DC fan, relay module, and required connections.
	Planned the fan-control logic based on the measured greenhouse temperature.
	Prepared the initial circuit layout for the temperature and fan-control section.
2	Connected the DHT22 sensor with the ESP32 and checked temperature and humidity readings.
	Connected the DC fan through the relay module and power supply.
	Tested the basic ON/OFF operation of the fan.
3	Implemented the automatic fan-control logic using the DHT22 sensor.
	Programmed the fan to turn ON when the temperature exceeds the selected threshold and turn OFF when the temperature returns to a suitable range.
	Developed the LCD display code to show sensor readings and system status.
4	Integrated the 16×2 I2C LCD with the ESP32 and verified the displayed information.
	Designed and updated the Proteus circuit diagram for the Smart Greenhouse Monitoring System.
	Checked the circuit connections and corrected wiring or simulation issues during testing.
5	Participated in the final full-system integration and testing.
	Verified that the temperature sensor, fan control, and LCD display worked correctly with the complete system.
	Finalized the Proteus design and contributed to troubleshooting and final demonstration preparation.
